Otterpie policies

Terms of Service

Please read these terms before using Otterpie wallet tools, Bot Accounts, or submitting a blockchain transaction.

Last updated: November 4, 2026

01 Using Otterpie

Otterpie provides wallet, transaction, category-planning, swap, bridge, and BOT Chain Bot Account tools. These terms apply when you access or use the service. If you do not agree, do not use Otterpie.

You are responsible for protecting your wallet and devices and for activity authorized through your connected wallet. Wallet sign-in verifies control of your public address; it does not submit a blockchain transaction. Contact the service operator promptly if you believe your account or device has been accessed without permission.

Otterpie is experimental software. Features may be incomplete, change, be unavailable, or display delayed or inaccurate information. Verify transaction details independently before approving a mainnet transaction.

02 Wallets and custody

When you connect an EVM wallet or Freighter through Cordy Minikit, the wallet provider controls the private key. Otterpie receives the public address and verifies wallet ownership with a SIWE or SEP-10 authentication signature. That authentication signature is not a transfer approval. Review each separate transaction request in your wallet before signing it.

Bot Accounts are app-managed BOT Chain wallets, separate from the wallet you use to sign in. Their private keys are encrypted and handled by the service for Bot Account operations. By funding or using a Bot Account, you understand the service can submit transactions from that account as part of the feature you request, including automated execution if you enable LIVE mode. Do not deposit funds unless you accept this managed-wallet arrangement and its risks.

You are responsible for checking the selected network, destination address, token, amount, and transaction details. Otterpie cannot recover assets sent to an incorrect address or network.

03 External wallets and WalletConnect

Supported bridge routes can connect an external EVM wallet using WalletConnect or a Tron wallet using TronLink. Connecting a wallet shares the public address and connection or network information needed for the flow. A connection alone does not submit a transaction; you must review and approve transaction requests in your wallet.

WalletConnect, TronLink, and the wallet providers are independent services with their own terms, privacy practices, and availability. Otterpie does not receive the private keys for wallets connected through these providers. Review the network, token, amount, destination, and transaction details in your wallet before signing.

04 Swaps and bridge transfers

The app supports swaps on configured BOT Chain markets, subject to available liquidity, contract behavior, and the quote shown in the app. Prices can move between quote and execution. Slippage, price impact, token behavior, low liquidity, or contract and network issues may cause a transaction to execute at a different result or fail; a failed transaction may still consume network fees.

The USDT bridge currently supports transfers between BOT Chain and Ethereum, BNB Smart Chain, and Tron. Stellar accounts can bridge USDT0 outbound to Ethereum and Arbitrum One through LayerZero; inbound transfers to Stellar are not currently available in Otterpie. Bridge transfers depend on the relevant contracts, validators, destination network, and third-party wallet providers; delivery can be delayed or fail, and Otterpie cannot guarantee a completion time or recover assets sent to an incorrect destination.

Stellar Testnet has no bridge support. Stellar Mainnet's configured USDT0 bridge route is separate from the BOT Chain USDT routes. Only use a route shown as available in the app, and check the source network, destination, token, amount, and fees before signing.

Bridge fees and minimums depend on direction and the live bridge rules. The current BOT Chain bridge documentation describes an outbound fee and a minimum transfer amount; the app may show a live quote that changes. Source-network gas or resource fees may also apply. Review the quote and official bridge details before confirming.

05 Bot Accounts and automated trading

Bot Accounts are separate, app-managed BOT Chain wallets. You control account settings through Otterpie, but the service holds the encrypted key material needed to sign Bot Account transactions. Keep only funds you are prepared to risk in a Bot Account and retain enough BOT for network fees.

The Bot Account strategy in PAPER mode simulates trades and does not submit automated swaps or represent actual returns; manual swaps are a separate user-initiated feature. LIVE mode can submit automated on-chain swaps from the selected Bot Account when you enable it and the server’s global switch, account settings, market assignment, balance, gas reserve, caps, and other safety checks permit execution. The service may reject a trade or automatically return an account to PAPER mode as a safety measure. These controls reduce risk but cannot guarantee against loss.

Signals, confidence scores, charts, projections, and performance summaries are informational. They are not recommendations or guarantees of future results. Market data may be delayed or incomplete; automated strategies can lose some or all of the funds in a Bot Account. You are responsible for choosing mode, assigned markets, settings, and funding, and for monitoring the account.

Bot Trading currently operates on configured BOT Chain markets. Market assignments limit automated bot activity; manual swaps remain subject to the selected account’s available balance and the quote/confirmation flow.

06 Friends

Friends lets you add Otterpie accounts by their connected wallet address, view a wallet address associated with the account, and send supported assets when the recipient wallet is on a compatible

network. You are responsible for confirming the address, asset, network, and amount. A blockchain payment is independent of the friend-list relationship and cannot be reversed by removing a friend.

07 Blockchain transactions and network fees

Blockchain transfers are generally public and irreversible after confirmation. Before submitting a transfer, verify the destination address, network, token, and amount. You authorize Otterpie to submit a transfer when you complete the confirmation flow in the app.

Transactions depend on third-party blockchain networks and providers. Network availability, fees, confirmation times, and protocol rules can change. Network fees are separate from Otterpie and are paid according to the network's rules. Otterpie cannot reverse, cancel, or guarantee the outcome of a confirmed transaction.

Displayed balances and transaction information may be delayed or incomplete while a network or provider is unavailable. They are informational and do not replace checking the relevant blockchain explorer or wallet.

08 Acceptable use

Use Otterpie only in a lawful manner and do not interfere with the service or other users.

- Do not attempt to access another person's account, wallet, or data.
- Do not use the service to facilitate fraud, theft, sanctions evasion, or other unlawful activity.
- Do not probe, disrupt, overload, or bypass the service's security controls.

09 Availability and changes

Otterpie may change, suspend, or discontinue features to maintain or protect the service. We do not promise uninterrupted access or a particular transaction result. We will update this page when these terms change; continued use after an update means the updated terms apply, to the extent permitted by law.

10 No financial or legal advice

Otterpie provides software tools, not financial, investment, tax, or legal advice. You are responsible for deciding whether to use a network or make a transaction and for understanding the risks and rules that apply to you.

11 Your legal rights

The service is provided subject to rights and protections that cannot be excluded under applicable law. Nothing in these terms removes those rights. If any part of these terms cannot be enforced, the remaining parts continue to apply to the extent permitted by law.
